Matt McGlothlin

Evolution of Honeywell's Safety Suite, a global gas detection and safety management platform.

The goal: transform a fragmented legacy ecosystem into an intelligent, connected experience that empowers industrial workers, safety managers, and technicians through AI, NFC, and a modern design system.

I led the user experience strategy and design — defining the onboarding flow, AI interactions, and dashboard systems, and helping shape the integration of Honeywell Forge 2.0 across the new experience.

Current state workflows

I deconstructed Safety Suite's existing screens and workflows for:

- Device setup and configuration
- Check-in / Check-out (device assignment)
- Fleet management
- Real-time monitoring
- Safety outcomes and reporting

This analysis revealed deeply nested flows and redundant paths — many users had to switch between desktop apps, mobile apps (Safety Communicator, Device Configurator), and docking stations just to perform simple tasks like firmware updates or alarm calibration.

Key friction points identified:

- Inconsistent BLE pairing experiences
- Confusion around gateway vs. dock vs. mobile connectivity
 - Manual user-role assignments and lack of onboarding guidance
 - Fragmented data between fleet health, device usage, and safety outcomes

These insights became the baseline for mapping improvement opportunities.

Matt McGlothlin

understand how Safety Suite's legacy experience functioned — not from documentation, but from the user's lived perspective.

To do that, I mapped the entire Safety Suite ecosystem using a unified visual language of boxes, arrows, and a custom legend.

Each color and symbol represented a specific interaction type:

- Pages – primary views or dashboards
- Modals – secondary, task-based

interactions

- Navigation paths – directional arrows showing user journeys

showing user journeys

- Tabs – nested content areas
- Subprocesses – loops or dead-end flows where users often got stuck

where users often got stuck

This model became a “single source of truth” for understanding how all modules connected — including Device Configurator, Fleet Manager, Real-Time Monitoring, and Safety Outcome]

Findings from the Workflow Map

Once visualized, patterns began to emerge:

- The system had overlapping entry points for similar tasks (e.g., device configuration accessible from multiple menus).
- Key workflows like “Assign Device” and “Add Site” were buried two or three layers deep, often behind modal dialogs.
- The navigation hierarchy wasn't role-based — managers, technicians, and admins all saw the same menus, creating cognitive overload.
- There were multiple redundant loops, especially in setup and reporting, that added unnecessary clicks and confusion.

This mapping exercise clarified why users felt lost — not because the product lacked capability, but because its architecture had grown organically over time without a unified IA strategy.

Using the Map as a Design Tool

Matt McGlothlin

could be consolidated under Forge 2.0.

- Used it in stakeholder workshops to show where friction occurred.
- Annotated it with AI-generated insights (from VOC and app store reviews) to pinpoint pain points and prioritize redesign areas.

This diagram directly informed how we structured the new EWAS navigation model — collapsing redundant pages into single, multi-context modules and introducing a guided setup path for first-time users.

Matt McGlothlin

Competitive Analysis — Benchmarking Best-in-Class Safety Systems

Next, the UX team and I compared Honeywell's experience with leading safety platforms — MSA Grid, Blackline Live, Dräger Gas Detection Connect, Industrial Scientific iNet, and WatchGas SST

Matt McGlothlin

- Dräger: Cloud-based monitoring with role-based permissions
- WatchGas: Compliance kiosks with NFC tap-to-assign simplicity

By plotting these differentiators against Honeywell's current UX, I identified four experience gaps to address:

1. Simplified onboarding (reduce steps and technical jargon)
2. Smart device assignment (NFC/QR tap-based pairing)
3. Unified visibility (fleet + worker + compliance in one dashboard)
4. Guided AI assistance (reduce dependency on support)

Enterprise Worker & Asset Safety

MV01 UX DIFFERENTIATION

UX IMPROVEMENTS

SOFTWARE FRAMEWORK & DESIGN SYSTEM UPDATE

SCUF / HCUI

- Last update in 2022.
- Rendering issues due to different React versions.
- Not accessible.

Forge 2.0

- Supported by Honeywell Connected Enterprise.
- Accessibility compliant.
- Missing mobile components.

Safety Suite Usability Testing – Validating Pain Points

We conducted usability walkthroughs with field technicians, product SMEs, and support engineers using the current Safety Suite.

Sessions included real-world tasks such as:

- Connecting a BW Flex or MicroRAE via BLE
- Assigning a worker to a device
- Exporting calibration data

Findings:

- Error handling was weak — users often abandoned the setup when pairing failed.
- System feedback was unclear (“Success” messages appeared even when the connection wasn’t established).

Matt McGlothlin

contextual help in EWAS.

Translating Insights into Design Improvements

By combining the workflow inefficiencies, competitive benchmarks, and usability testing insights, we created a clear set of UX goals

Matt McGlothlin

Designing the Onboarding Experience

We completely reimagined how devices and users join the platform.

The old multi-step manual setup became a guided, adaptive onboarding journey informed by pre-qualification questions and real-time connectivity detection .

Matt McGlothlin

- Smart connection detection: Automatically recommends the best connection type (gateway, mobile, or wired).
- AI-guided troubleshooting: Provides instant feedback when a connection fails — suggesting likely fixes and tutorials.
- Interactive onboarding tour: Contextual help and guided walkthroughs reduce training time for new users

ve

Fleet & Asset Management Redesign

We rebuilt the Fleet Management dashboard with real-time visibility into:

- Device status, calibration health, and battery life
- Worker assignments and site locations
- License management and compliance summaries

The dashboard leverages Honeywell Forge 2.0 components for data consistency and performance, blending cloud analytics with edge intelligence for low-latency insights.

FEEDBACK

Matt McGlothlin

The image displays two user interface designs. The desktop interface on the left is titled 'Add new user' and is divided into two main sections: 'BASIC INFORMATION' and 'WORK DETAILS'. The 'BASIC INFORMATION' section includes fields for First Name, Last Name, Email, Country Code (with a dropdown for 'USA (+01)'), and Phone. The 'WORK DETAILS' section includes Site (dropdown), Department (dropdown), Work Classification (radio buttons for Employee and Contractor), and Reporting manager (dropdown). Below these is a 'ROLES' section with a table listing roles: Global Administrator (checked), Supervisor, Operator, and Viewer. A search bar is present above the table. At the bottom are 'Cancel' and 'Save' buttons. The mobile interface on the right is titled 'Add new team' and includes fields for Site (dropdown), Team name, Site name, and Seat 1. It also has 'Add user' and 'Add team' buttons. Both interfaces feature a 'Complete the following' section with a prompt to provide required information.

AI in the Experience

AI served both as a design partner and a product capability.

I used MS Copilot to accelerate ideation:

- Generated first-pass flows and onboarding logic trees
- Synthesized data points from VOC, field notes, and app reviews
- Explored edge-case conversation scenarios with firmware and product SMEs

2. AI in the Product

- Maintenance Assist: Context-aware AI that explains setup errors, recommends configuration sequences, and assists in troubleshooting.
- Predictive Analytics: AI models infer fleet readiness from calibration/test logs.
- Behavioral AI: Drawing from IoB/IoB trends, worker data helps predict risk patterns — balancing productivity and safety.

Matt McGlothlin

NFC / QR Innovation

A key competitive differentiator was introducing NFC and QR-based device assignment.

How it Works

- Workers tap or scan a detector to instantly assign it before a shift.
- Auto check-in/out updates worker-device pairing in real time.
- The system syncs with cloud fleet management even when offline.

Benefits

- Eliminated manual entry errors
- Improved accountability
- Simplified shift handoffs
- Strengthened compliance traceability

Matt McGlothlin

Design System & Dashboards

We implemented the Honeywell Forge 2.0 Design System for visual and interaction consistency:

- Modular cards and analytics widgets
- Accessible color palette and high-contrast data visuals

Reflection

This project taught me that AI in industrial design isn't about automation — it's about augmentation. By merging research, empathy, and intelligent systems, we created a more human, transparent, and scalable way for teams to stay safe and productive.

Next Steps

- Integrate Maintenance Assist directly into Forge
- Expand NFC/QR to fixed detection devices
- Launch AI-driven compliance reports and predictive maintenance modules
